# Executive Summary: Air Quality in Our Area

## Air Quality in Rother

Air pollution is associated with a number of adverse health impacts. It is recognised as a contributing factor in the onset of heart disease and cancer. Additionally, air pollution particularly affects the most vulnerable in society: children and older people, and those with heart and lung conditions. There is also often a strong correlation with equalities issues, because areas with poor air quality are also often the less affluent areas[1,2].

The annual health cost to society of the impacts of particulate matter alone in the UK is estimated to be around £16 billion[3].

The District of Rother is the second-largest district in East Sussex, and one of the most rural districts in England.  Road traffic is the dominant source of air pollution in the area, the major routes being the A21, the A28, the A265, the A258, the A27 and the A268.  The main pollutants of concern with respect to road traffic are nitrogen dioxide ($NO_2$) and particulate matter ($PM_{10}$ and $PM_{2.5}$).  Currently, there are no areas in Rother where members of the public are exposed to levels of these pollutants in excess of the UK Air Quality Objectives.

Rother District Council manages local air quality in close collaboration with East Sussex County Council, which provided part of the monitoring until 2014, and with the Sussex Air Quality Partnership (Sussex Air).  The partnership provides assistance to members and information to the public via its web-site with recent air quality data, news updates, educational resources, links and other services such as airAlert.

In recent years, local monitoring has identified elevated levels of $NO_2$ at three roadside locations (Rye South Undercliff, High Street Flimwell and A2100 Beauport Park).  $NO_2$ levels at these locations in 2013 and 2014 exceeded, or were close to exceeding the UK Air Quality Objective for annual mean $NO_2$. In 2015, all monitoring locations in the District achieved the objective, with concentrations lower than 40 µg/m$^3$.  In 2016 however, concentrations exceeded the objective at A2100

[2] Air quality and social deprivation in the UK: an environmental inequalities analysis, 2006
[3] Defra. Abatement cost guidance for valuing changes in air quality, May 2013

Beauport Park and High Street Flimwell, although concentrations in 2017 returned to below the objective at these locations and all others.

$PM_{10}$ is monitored in Rother at De La Warr Road, Bexhill, and in recent years concentrations have been generally low (well below the UK annual mean objectives), with no significant increasing or decreasing tendency, although there is some year-on-year variability.

As in other suburban and rural areas of East Sussex, ozone ($O_3$) is of considerable concern. Ozone is monitored at Rye Harbour, where high levels have been monitored since 2011.

A large area of the countryside in the District is within the High Weald Area of Outstanding Natural Beauty (AONB). The impact of traffic-related air pollution on some of these areas has been assessed in past years. Current and future traffic flows are not expected to put the Pevensey Levels Special Area of Conservation (SAC) at risk from excessive nitrogen deposition.

## Actions to Improve Air Quality

Rother District Council is helping the public to avoid the worst effects of ozone pollution by monitoring ozone levels at Rye Harbour, and informing the public of pollution events through the airAlert pollution warning service. This service is provided and maintained through the Sussex Air partnership. As of March 2018 the airAlert service had 971 registered subscribers in Sussex, 46 of which are from the Rother District. Rother, along with other Sussex Air partners, are in discussions relating to a potential upgrade of the Sussex Air website, which would further improve the quality of information accessible to the general public on air quality matters.

Rother District Council, together with Sussex Air and other local authorities across Sussex and Kent, supports the Energise Network, an integrated network of electric charging points for vehicles. Charging points are now located across East and West Sussex, Kent, Surrey, Greater London and neighbouring counties.

Rother District Council contributes to the Air Quality and Emissions Mitigation Guidance for Sussex. The guidance supports the principles of the Sussex Air Quality Partnership to improve air quality across Sussex, encourage emissions reductions and improve the environment and health of the population. Other actions being implemented to improve public health include promoting active modes of

transportation like walking, cycling and using public transport, as well as car clubs and car sharing.

## Conclusions and Priorities

Annual mean $NO_2$ concentrations recorded at continuous monitors and diffusion tubes in Rother District are within the air quality annual mean objective of 40 µg/m$^3$, and there were no exceedances of the short term hourly objective.

There were also no exceedances of either the annual mean or daily mean $PM_{10}$ objectives in 2017, or for the previous years from 2013.

In conclusion, monitoring has shown that air quality in Rother District continues to meet the air quality objectives at locations of relevant exposure.  Rother District is committed to taking action to nonetheless improve air quality, in particular through involvement with the Sussex Air Quality Partnership.  Priority measures and actions for the District include the roll-out and expansion of electric charging points via the Energise Network, collaboration between departments on health improvement, climate change, environment and transport, and maintaining and updating the website, airAlert scheme and monitoring network.

The main challenge for air quality management in Rother District is likely to be the careful management of planning applications and developments through detailed and rigorous air quality assessments, particularly where multiple developments may occur close together, in order to help maintain the generally good levels of local air quality that are currently experienced across the District.

## Local Engagement and How to get Involved

Everyone concerned about air quality in Rother and the rest of Sussex can find real-time information on pollution levels on the Sussex Air website sussex-air.net.  People are encouraged to sign up for advance warnings with the airAlert service at airalert.info.  Warnings are provided by text or voice message, email, or using an Android or iOS app.  The service is also available to schools and is a great way to get everyone engaged in thinking about the importance of air quality.

Drivers planning to replace their vehicles are encouraged to consider low and ultra-low emission vehicles, such as electric cars, plug-in hybrids and extended-range electric vehicles. The Energise Network provides members with access to more than

150 electric vehicle charging points across the South East.  These include most local authority charge points in Kent, Surrey and Sussex, plus a number of Southern Rail fast chargers.  For more details, please visit https://www.zap-map.com/charge-points/public-charging-point-networks/energise-network/.

# Table of Contents

**List of Tables**

## List of Figures

# 1   Local Air Quality Management

This report provides an overview of air quality in Rother District during 2017. It fulfils the requirements of Local Air Quality Management (LAQM) as set out in Part IV of the Environment Act (1995) and the relevant Policy and Technical Guidance documents.

The LAQM process places an obligation on all local authorities to regularly review and assess air quality in their areas, and to determine whether or not the air quality objectives are likely to be achieved. Where an exceedance is considered likely the local authority must declare an Air Quality Management Area (AQMA) and prepare an Air Quality Action Plan (AQAP) setting out the measures it intends to put in place in pursuit of the objectives. This Annual Status Report (ASR) is an annual requirement showing the strategies employed by Rother District Council to improve air quality and any progress that has been made.

The statutory air quality objectives applicable to LAQM in England can be found in Table E.1 in Appendix E.

# 2    Actions to Improve Air Quality

## 2.1  Air Quality Management Areas

Air Quality Management Areas (AQMAs) are declared when there is an exceedance or likely exceedance of an air quality objective. After declaration, the authority must prepare an Air Quality Action Plan (AQAP) within 12-18 months setting out measures it intends to put in place in pursuit of compliance with the objectives.

Rother District currently does not have any AQMAs, because previous monitoring and modelling studies have not indicated any likelihood of the UK air quality objectives being exceeded.

Since Rother District has no AQMAs, no formal Air Quality Action Plan has been implemented for the District.

## 2.2  Progress and Impact of Measures to address Air Quality in Rother District

Defra's appraisal of last year's ASR[4] concluded that the report was well structured and provided the required information as specified in the guidance, with acceptable conclusions reached.  The appraisal identified potential for a review of the monitoring programme in light of $NO_2$ concentrations being generally well below the AQO, to identify potential new locations of relevant exposure in areas with congested traffic. Rother District conducted this review and added two new diffusion tube locations in 2017.

Rother District Council has taken forward a number of direct measures during the current reporting year of 2017 in pursuit of improving local air quality. Details of all measures completed, in progress or planned are set out in Table 2.1.

Rother District Council is a member of the Sussex Air Quality Partnership (Sussex Air), which produced an air quality strategic plan 2010 to 2015[5].  Rother District Council contributed to the development of this strategy, which aims to provide a consistent approach to air quality across a number of district councils.

---

[4] 2017 Rother District Annual Status Report (ASR), available at:  http://www.rother.gov.uk/article/193/Air-Quality
[5] Sussex Air Quality Partnership Air Quality Strategic Plan 2010 http://www.sussex-air.net/Reports/SAQP_Vision_Strategy_2015.pdf

This plan has 5 key objectives:

1. Provide advice and support and improve the expertise and knowledge base

2. Project development and implementation

3. Partnership working

4. Develop cross cutting work on health improvement, climate change, environment and transport

5. Communicate air quality issues and initiatives in Sussex.

Key completed measures are:

1. Website

   Rother District Council supports the Sussex Air Quality website (http://www.sussex-air.net), which provides access to air quality statistics and relevant local information and improves public awareness of air quality.

2. airAlert

   Rother District Council supports the airAlert air pollution warning service, offered by the Sussex Air Quality Partnership to vulnerable people, schools, health professionals and general public in Sussex. The airAlert service provides warnings based on ozone levels monitored within the Rother District at Rye Harbour. As of July 2017 the service had 921 registered subscribers, 46 of which are from the Rother District.

3. Local ozone monitoring

   High ozone levels can cause difficulty in breathing for vulnerable people with existing breathing or heart conditions.  Rother District Council monitors ozone levels at the Rye Harbour rural monitoring station.  Data from this station is available on the Sussex-Air website and feeds into the airAlert service.

4. Guidance

   Rother District Council contributed to the Air Quality and Emissions Mitigation Guidance for Sussex, first published in 2013 and updated in 2014. The guidance is helping to mitigate potential air quality impacts from developments across Sussex. It is also contributing to improving public health by promoting active

modes of transportation like walking, cycling and using public transport, as well as car clubs and car sharing.

5. Energise Network.

   Energise was established as a public/private sector partnership by local authorities across Sussex, Surrey and Kent and was led by the Sussex Air Partnership, to help support the promotion of electric vehicle uptake in the region, by making access simpler. Electric car charging points are now located across East and West Sussex, Kent, Surrey, Greater London and neighbouring counties.

6. Garden Bonfires

   Rother District Council, in partnership with Wealden District Council, published in 2013 public-facing material discouraging the practice of burning garden waste, and encouraging sustainable alternatives such as composting and recycling.

Together with neighbouring local authorities, Rother District Council has been assessing the air quality impacts of new traffic and development on protected natural habitats and designated sites in the District, in particular the Pevensey Levels (Special Area of Conservation (SAC) and Ramsar site), the Dungeness SAC and the Dungeness to Pett Level Special Protection Area (SPA).

Key completed measures regarding protected habitats are:

1. Pevensey Levels Assessment

Rother District Council commissioned in 2009 a study[6] to assess the potential air quality impact on the Pevensey Levels of increases in traffic on the A259 associated with planned population growth up to 2026. The conclusion was that an increase in nitrogen deposition and NOx concentrations is likely, but these will still be below the Critical Levels set by the Habitats Directive[7], therefore there is unlikely to be a significant effect on the Ramsar site.

---

[6] Rother District Council, Hastings Borough Council. Wealden District Council and Eastbourne Borough Council (2009). Appropriate Assessment and Air Quality Local to the Pevensey Levels Ramsar Site. Available at: http://www.wealden.gov.uk/nmsruntime/saveasdialog.aspx?IID=14305&sID=5509

[7] EC Habitats Directive 1992, interpreted into British law by the Conservation (Natural Habitats &c) Regulations 1994 (as amended in 2007).

2. Dungeness Sites Protection

Rother District Council currently screens all business development applications in the Port of Rye for their potential to have adverse effects on the integrity of the Dungeness internationally-designated sites. The main focus is on traffic and shipping emissions, and where necessary, makes recommendations for mitigation measures to be implemented[8].

Rother District Council is a programme partner for East Sussex County Council's 'Active Access for Growth' programme to deliver cycling and walking initiatives in key areas which includes South Wealden and Bexhill/Hastings.

One of the 3 key objectives of the programme includes 'to demonstrate an alignment to health, air quality, and reduce vehicle emissions' via the following initiatives. Starting with those introduced in 2017:

- Pedal Power - Cycle/Electric Cycle Loan Scheme (including associated research by Brighton University on type and duration of journeys/energy expenditure)

- Living Streets 'Walk Doctors' – Journey planning

- Living Streets – Active Travel Maps

- Walking & Cycling – Challenges & Pledges

- East Sussex Wheels 2 Work – Moped/Motorcycle Loan

- Independent Travel Training – Integrated Travel

- Discounted public transport travel

- Walking & Cycling Leader Training

- East Sussex Cycle Hubs – Bikeability Plus Services

- Transition travel activities - secondary

- Use of sustainable travel apps & other technology

- Student led Walking & Cycling Campaigns

- Walking & cycling challenges – 'Free your Feet'

---

[8] Rother District Council (2014). Local Plan – Core Strategy. Adopted 29th September 2014.

- Living Streets - Community Audit Scheme: to identify safer walking & cycling routes

- East Sussex County Council - Community Grant Scheme – Active Access – supporting local walking and cycling initiatives (such as cycle refurbishment)

- Community walking & cycling challenges

- South Downs National Park - Led Walks/Rides

A new initiative for 2018:

- Sustrans - Active steps scheme

Rother District Council expects the following updates over the course of the next reporting year:

- The development of the National Coastal Path from Eastbourne to Camber to link to existing walks and cycle routes such as the 1066 Walks and Coastal Cultural Trail.

- Regulation 123 of the Community Infrastructure Levy (CIL) Regulations requires charging authorities to set out a list of those projects or types of infrastructure that it intends to fund either wholly or partially through the CIL levy. Rother's preferred CIL spending relevant to Air Quality is as follows:

  **Rail:**
  - Access improvements to stations which may include additional car parking, cycle and
  - pedestrian access and facilities based on findings of East Sussex County Council (ESCC) Station Audit and plans of train
  - Operating companies.
  - Bus, Cycling and Walking Infrastructure:
  - Bus stop accessibility
  - Bus shelters
  - Passenger information and electronic ticketing
  - Speed management measures

- Passenger and public security and safety

**Bus, Cycling and Walking Infrastructure:**

- Bus stop accessibility

- Bus shelters

- Passenger information and electronic ticketing

- Speed management measures

- Passenger and public security and safety

- Bus reliability measures

- Passenger access and information improvements to railway stations

- Cycle network improvements

- Public realm improvements

- Safety infrastructure outside schools

- Rights of way improvements

- Improvements to walking and cycling infrastructure to ensure connectivity and accessibility of new development into existing networks, communities, town and secondary centres, employment & social infrastructure in accordance with Rother's Cycling and Walking Strategy.

- Management of cross town traffic congestion in Battle. Improved traffic management. Implement measures to increase use of sustainable transport in accord with LTP3.

- Introduce measures to tackle heavy congestion in Rye town centre during the summer. Increase sustainable transport provision in the town in accord with LTP3.

## Table 2.1 – Progress on Measures to Improve Air Quality

| Measure No. | Measure | EU Category | EU Classification | Organisations involved and Funding Source | Planning Phase | Implementation Phase | Key Performance Indicator | Reduction in Pollutant / Emission from Measure | Progress to Date | Estimated / Actual Completion Date | Comments / Barriers to implementation |

## 2.3 PM$_{2.5}$ – Local Authority Approach to Reducing Emissions and/or Concentrations

As detailed in Policy Guidance LAQM.PG16 (Chapter 7), local authorities are expected to work towards reducing emissions and/or concentrations of PM$_{2.5}$ (particulate matter with an aerodynamic diameter of 2.5µm or less). There is clear evidence that PM$_{2.5}$ has a significant impact on human health, including premature mortality, allergic reactions, and cardiovascular diseases.

Rother District Council is taking the following measures to address PM$_{2.5}$:

- Continuing to support the Energise Network of electric vehicle charging points, together with the Sussex Air Quality Partnership;

- Requiring the assessment of PM$_{2.5}$ as part of Air Quality Assessments for planning applications to inform emission mitigation strategies.

- Publishing information discouraging the burning of garden waste and encouraging sustainable alternatives such as composting and recycling.

Further measures will be considered in future years.

# 3 Air Quality Monitoring Data and Comparison with Air Quality Objectives and National Compliance

## 3.1 Summary of Monitoring Undertaken

This section sets out what monitoring has taken place and how it compares with objectives.  For reference, maps of Rother District's monitoring locations are provided in Appendix D.

### 3.1.1 Automatic Monitoring Sites

Rother District undertook automatic (continuous) monitoring at 2 sites during 2017: De La Warr Road, Bexhill (RY2, monitoring $NO_2$ and $PM_{10}$) and Rye Harbour (RY1, monitoring ozone ($O_3$)).  Fine particulate matter ($PM_{2.5}$) is currently not monitored in the District. Table A.1 in Appendix A shows the details of the automatic monitoring sites.

Both stations are part of the Sussex Air Quality Monitoring Network (SAQMN), managed on behalf of Sussex Air by King's College London Environmental Research Group (KCL-ERG). Regional monitoring results are available at www.sussex-air.net.

Data capture for 2017 was good, as outlined below:

- De La Warr Road, Bexhill: 99.4% for $NO_2$, 98.5% for $PM_{10}$; and

- Rye Harbour: 94.6% for $O_3$.

Further details on how the monitors are calibrated and how the data has been adjusted or annualised are included in Appendix C.

### 3.1.2 Non-Automatic Monitoring Sites

Rother District Council undertook non-automatic (passive) monitoring of $NO_2$ at 20 sites during 2017, which includes two new sites.  Triplicate diffusion tubes are co-located with the De La Warr Road automatic monitoring station for the derivation of a local bias adjustment factor.

Due to repeated tube theft at Rye Cinque Ports Street (DT19), monitoring was ceased at this site at the end of 2016.  This site was later reinstated in a slightly different location along Cinque Ports Street in May 2017, where data capture has significantly improved.  The diffusion tube at Rye South Undercliff (DT21) was

relocated in September 2016 to another (new) location (A259 Bowling Green, Rye; DT30) due to a temporary issue with accessing the site.  The Rye South Undercliff (DT21) diffusion tube site was reinstated at the original location in March 2017 after issues with access to the site had been resolved, and monitoring continued at the new DT30 site.

A second new diffusion tube site (DT31) was also commissioned in March 2017 at 128 Barnhorn Road, Bexhill.

Table A.2 in Appendix A shows the details of the sites.  Maps showing the location of the monitoring sites are provided in Appendix D. Further details on Quality Assurance/Quality Control (QA/QC) for the diffusion tubes, including bias adjustments and any other adjustments applied (e.g. "annualisation" and/or distance correction), are included in Appendix C.

## 3.2  Individual Pollutants

The air quality monitoring results presented in this section are, where relevant, adjusted for bias, "annualisation" and distance correction. Further details on adjustments are provided in Appendix C.

### 3.2.1  Nitrogen Dioxide (NO$_2$)

Table A.3 in Appendix A compares the ratified and adjusted monitored NO$_2$ annual mean concentrations for the past 5 years with the air quality objective of 40µg/m$^3$.

For diffusion tubes, the full 2017 dataset of monthly mean values is provided in Appendix B.

The results indicate that the annual mean NO$_2$ concentrations at the De La Warr Road, Bexhill automatic monitoring site were well within the UK air quality objective (40 µg/m$^3$) in all years between 2013 and 2017.

All diffusion tube sites achieved the air quality objective in 2017, with the highest concentration of 39.1 µg/m$^3$ monitored at DT3 (Beauport Park).  There were exceedances of the objective in 2013 at DT21 (Rye South Undercliff) and in 2016 at DT3 (Beauport Park) and DT12 (High St Flimwell), however it should be noted that these exceedances are based on the monitored concentrations at the diffusion tube site; when distance-corrected for relevant exposure, annual mean NO$_2$

concentrations in all years from 2013 to 2017 are well within the objective. Appendix B provides details of distance-corrected annual mean $NO_2$ concentrations in 2017.

Table A.4 in Appendix A compares the ratified continuous monitored $NO_2$ hourly mean concentrations for the past 5 years with the air quality objective of 200μg/m$^3$, not to be exceeded more than 18 times per year.

The De La Warr Road, Bexhill automatic monitoring site did not exceed the 200 μg/m$^3$ standard in any year in the 2013 to 2017 period.

Diffusion tubes cannot provide hourly measurements of $NO_2$; however, the Defra Technical Guidance states that where annual mean $NO_2$ concentrations measured by diffusion tubes exceed 60 μg/m$^3$ there is a likelihood that the 1-hour objective may be exceeded. All of the annual mean $NO_2$ concentrations at diffusion tube monitoring locations between 2013 and 2017, inclusive, were well below 60 μg/m$^3$ and so the 1-hour objective is very unlikely to have been exceeded. The results indicate that the 1-hour $NO_2$ air quality objective is unlikely to be exceeded at any location in the district.

### 3.2.2 Particulate Matter (PM$_{10}$)

PM$_{10}$ concentrations are monitored at the De La Warr Road, Bexhill site. Table A.5 in Appendix A compares the ratified and adjusted monitored PM$_{10}$ annual mean concentrations for the past 5 years with the air quality objective of 40μg/m$^3$. The results indicate that annual mean PM$_{10}$ concentrations were well below the UK air quality objective between 2013 and 2017.

Table A.6 in Appendix A compares the ratified continuous monitored PM$_{10}$ daily mean concentrations for the past 5 years with the air quality objective of 50μg/m$^3$, not to be exceeded more than 35 times per year. These results show that the De La Warr Road site achieved the daily PM$_{10}$ objective every year from 2013 to 2017.

### 3.2.3 Particulate Matter (PM$_{2.5}$)

There is no PM$_{2.5}$ monitoring undertaken within Rother District. The annual mean PM$_{10}$ concentrations measured at the De La Warr Road site have been used to estimate PM$_{2.5}$ annual average concentrations by using the nationally-derived correction ratio of 0.7 suggested in Defra's Technical Guidance. Based on this assumption, the estimated annual mean PM$_{2.5}$ concentrations during the 2013 to

2017 period were in the range of 13 µg/m$^3$ to 18 µg/m$^3$ (see Table A.7 in Appendix A).

### 3.2.4      Sulphur Dioxide (SO$_2$)

Monitoring of sulphur dioxide is not carried out at any location within the district. Therefore, no results are presented in this section.

### 3.2.5      Ozone (O$_3$)

Table A.8 in Appendix A presents the ratified continuous monitored O$_3$ concentrations for the past 5 years at the Rye Harbour rural site.  Due to low data capture during 2015 there are no results presented for that year.  Between 2013 and 2017, the annual mean O$_3$ concentrations ranged from 51 µg/m$^3$ to 57 µg/m$^3$.  There is no annual mean objective or target value for O$_3$.

Table A.9 in Appendix A compares the ratified continuous monitored running 8-hour mean O$_3$ concentrations for the past 5 years with the UK Air Quality Objective of 100 µg/m$^3$, not to be exceeded on more than 10 days per year. The monitoring results show that the Rye Harbour monitoring site exceeded the O$_3$ running 8-hour mean objective in 2013, 2016 and 2017.  The highest number of days above the standard was in 2017, with 24 days.

# Appendix A: Monitoring Results

## Table A.1 – Details of Automatic Monitoring Sites

| Site ID | Site Name | Site Type | X OS Grid Ref | Y OS Grid Ref | Pollutants Monitored | In AQMA? | Monitoring Technique | Distance to Relevant Exposure (m) [1] | Distance to kerb of nearest road (m) [2] | Inlet Height (m) |

☒ **Diffusion tube data has been bias corrected**

☒ **Annualisation has been conducted where data capture is <75%**

**Notes:**

Exceedances of the $NO_2$ annual mean objective of 40µg/m³ are shown in **bold**.

$NO_2$ annual means exceeding 60µg/m³, indicating a potential exceedance of the $NO_2$ 1-hour mean objective are shown in **bold and underlined.**

(1) Data capture for the monitoring period, in cases where monitoring was only carried out for part of the year.

(2) Data capture for the full calendar year (e.g. if monitoring was carried out for 6 months, the maximum data capture for the full calendar year is 50%).

(3) Means for diffusion tubes have been corrected for bias. All means have been "annualised" as per Boxes 7.9 and 7.10 in LAQM.TG16 if valid data capture for the full calendar year is less than 75%. See Appendix C for details.

☒ **Local bias adjustment factor used**

☐ **National bias adjustment factor used**

☒ **Annualisation has been conducted where data capture is <75%**

☒ **Where applicable, data has been distance corrected for relevant exposure**

**Notes:**

Exceedances of the NO₂ annual mean objective of 40µg/m³ are shown in **bold**.

NO₂ annual means exceeding 60µg/m³, indicating a potential exceedance of the NO₂ 1-hour mean objective are shown in **bold and underlined.**

(1) See Appendix C for details on bias adjustment and annualisation.

(2) Distance corrected to nearest relevant public exposure.

# Appendix C: Supporting Technical Information / Air Quality Monitoring Data QA/QC

## Diffusion Tube Bias Adjustment Factors

Bias adjustment is effectively a calculated factor which shows whether diffusion tubes are over or under-reading ambient concentrations, thereby allowing a correction to be made.

Rother District Council has a co-location of triplicate diffusion tubes alongside the automatic continuous analyser at De La Warr Road, Bexhill. In 2017, data capture at the continuous monitoring site was almost 100% and therefore sufficient to allow a valid local bias adjustment factor[9] to be derived. The local bias adjustment factor was calculated to be 0.90. Figure 1 shows the calculation for the local bias adjustment factor.

## Figure 1: Local Diffusion Tube Bias Adjustment Factor for Rother District Council in 2017.

**Checking Precision and Accuracy of Triplicate Tubes**  —  AEA Energy & Environment (From the AEA group)

| Period | Start Date dd/mm/yyyy | End Date dd/mm/yyyy | Tube 1 $\mu gm^{-3}$ | Tube 2 $\mu gm^{-3}$ | Tube 3 $\mu gm^{-3}$ | Triplicate Mean | Standard Deviation | Coefficient of Variation (CV) | 95% CI of mean | Period Mean | Data Capture (% DC) | Tubes Precision Check | Automatic Monitor Data |

It is necessary to have results for at least two tubes in order to calculate the precision of the measurements

Overall survey --> **Good precision** / **Good Overall DC**

| Site Name/ ID: | | Precision | 12 out of 12 periods have a CV smaller than 20% | (Check average CV & DC from Accuracy calculations) |

**Accuracy** (with 95% confidence interval)
**without periods with CV larger than 20%**
Bias calculated using 12 periods of data
Bias factor A: 0.9 (0.84 - 0.97)
Bias B: 11% (3% - 20%)
Diffusion Tubes Mean: 24 $\mu gm^{-3}$
Mean CV (**Precision**): 5
Automatic Mean: 22 $\mu gm^{-3}$
Data Capture for periods used: 99%
Adjusted Tubes Mean: 22 (21 - 24) $\mu gm^{-3}$

**Accuracy** (with 95% confidence interval)
**WITH ALL DATA**
Bias calculated using 12 periods of data
Bias factor A: 0.9 (0.84 - 0.97)
Bias B: 11% (3% - 20%)
Diffusion Tubes Mean: 24 $\mu gm^{-3}$
Mean CV (**Precision**): 5
Automatic Mean: 22 $\mu gm^{-3}$
Data Capture for periods used: 99%
Adjusted Tubes Mean: 22 (21 - 24) $\mu gm^{-3}$

[9] Defra (2017), Local bias adjustment calculator, available at: https://laqm.defra.gov.uk/bias-adjustment-factors/local-bias.html

A national bias adjustment factor was also considered for use, obtained from the national database of bias adjustment factors (version 09/18)[10]. Figure 2 shows the national bias adjustment factor for the same laboratory (Gradko) and tube preparation method (20% TEA in water) used by Rother District Council. The national bias adjustment factor is 0.87.

## Figure 2: National Diffusion Tube Bias Adjustment Factor for Rother District Council in 2017.

## Discussion of Choice of Factor to Use

In 2017, it was possible to derive a local bias adjustment factor as well as the national bias adjustment factor obtained from the national database. Both the locally-derived and national bias adjustment factors were very similar in 2017, and so on the basis of applying a more conservative factor to raw diffusion tube concentrations, and

---

[10] Defra (2017), National bias adjustment factor database, available at: https://laqm.defra.gov.uk/bias-adjustment-factors/national-bias.html

the fact that the local factor is more appropriate to use when available and more likely to take into account effects local to the District, the local bias factor of 0.90 was used.

**PM Monitoring Adjustment**

The $PM_{10}$ data from the TEOM continuous analyser at De La Warr Road (RY2) has been corrected using the volatile correction model[11] (VCM) to ensure gravimetric equivalence.

**Short-term to Long-term Data Adjustment**

Data capture for the DT3 A2100 Beauport Park diffusion tube site in 2017 was 67%, and so annualisation was carried out using data from three continuous $NO_2$ analysers in background sites within 50 miles: Eastbourne – Holly Place (EB3), Lullington Heath (LH), and Brighton Preston Park (BRT3), which had 99%, 98% and 98% data capture, respectively.  The periods used in the annualisation calculation were February, April – August, November – December.  The average ratio of the annual mean to the period mean is the adjustment factor used. The details of this adjustment calculation are given in Table C.2.

**Table C.1 – Period Adjustment of 2017 $NO_2$ Data for DT3 (A2100 Beauport Park) diffusion tube monitoring site.**

| Site ID | Annual Mean Concentration (µg/m$^3$) | Period Mean Concentration (µg/m$^3$) | Annual Mean to Period Mean Ratio |
|---|---|---|---|
| EB3 | 12.2 | 11.5 | 1.06 |
| LH | 7.6 | 7.4 | 1.03 |
| BRT3 | 16.7 | 16.3 | 1.02 |
| Average Ratio | | | 1.04 |

Data capture for the DT19 Rye Cinque Ports Street diffusion tube site in 2017 was 67%, and so annualisation was carried out using data from three continuous $NO_2$ analysers in background sites within 50 miles: Eastbourne – Holly Place (EB3), Lullington Heath (LH), and Brighton Preston Park (BRT3), which had 99%, 98% and 98% data capture, respectively.  The period used in the annualisation calculation was

---

[11] King's College London Volatile Correction Model. Information available at: http://www.volatile-correction-model.info/

May – December.  The average ratio of the annual mean to the period mean is the adjustment factor used. The details of this adjustment calculation are given in Table C.2.

**Table C.2 – Period Adjustment of 2017 NO$_2$ Data for DT19 (Rye Cinque Ports Street) diffusion tube monitoring site.**

| Site ID | Annual Mean Concentration (µg/m$^3$) | Period Mean Concentration (µg/m$^3$) | Annual Mean to Period Mean Ratio |
|---|---|---|---|
| EB3 | 12.1 | 10.2 | 1.19 |
| LH | 7.6 | 6.5 | 1.18 |
| BRT3 | 16.7 | 15.2 | 1.10 |
| Average Ratio | | | 1.16 |

**QA/QC of Automatic Monitoring**

As previously described in Section 2.1, monitoring stations within East Sussex are part of the SAQMN and, therefore, measurements made at these sites are traceable to national standards and operational procedures defined for the regional network.

**QA/QC of Diffusion Tube Monitoring**

AIR is an independent analytical proficiency-testing (PT) scheme, operated by LGC Standards and supported by the Health and Safety Laboratory (HSL).  AIR PT is a new scheme, started in April 2014, which combines two long running PT schemes: LGC Standards STACKS PT scheme and HSL Workplace Analysis Scheme for Proficiency (WASP) PT scheme.

Defra and the Devolved Administrations advise that diffusion tubes used for Local Air Quality Management should be obtained from laboratories that have demonstrated satisfactory performance in the AIR PT scheme.

Rother District Council used Gradko International for the supply and analysis of diffusion tubes, with a 20% triethanolamine (TEA) in water preparation.  In all of the 8 most recent AIR PT testing rounds running from September 2016 until August 2018, Gradko achieved 100% satisfactory results, so there is high confidence in the accuracy of the diffusion tube results.

# Appendix E: Summary of Air Quality Objectives in England

### Table E.1 – Air Quality Objectives in England

| Pollutant | Air Quality Objective[12] | |
| --- | --- | --- |
| | Concentration | Measured as |
| Nitrogen Dioxide (NO$_2$) | 200 µg/m$^3$ not to be exceeded more than 18 times a year | 1-hour mean |
| | 40 µg/m$^3$ | Annual mean |
| Particulate Matter (PM$_{10}$) | 50 µg/m$^3$, not to be exceeded more than 35 times a year | 24-hour mean |
| | 40 µg/m$^3$ | Annual mean |
| Sulphur Dioxide (SO$_2$) | 350 µg/m$^3$, not to be exceeded more than 24 times a year | 1-hour mean |
| | 125 µg/m$^3$, not to be exceeded more than 3 times a year | 24-hour mean |
| | 266 µg/m$^3$, not to be exceeded more than 35 times a year | 15-minute mean |

---

[12] The units are in microgrammes of pollutant per cubic metre of air (µg/m$^3$).

# Glossary of Terms

| Abbreviation | Description |
|---|---|
| AQAP | Air Quality Action Plan - A detailed description of measures, outcomes, achievement dates and implementation methods, showing how the local authority intends to achieve air quality limit values' |
| AQMA | Air Quality Management Area – An area where air pollutant concentrations exceed / are likely to exceed the relevant air quality objectives. AQMAs are declared for specific pollutants and objectives |
| ASR | Air quality Annual Status Report |
| Defra | Department for Environment, Food and Rural Affairs |
| DMRB | Design Manual for Roads and Bridges – Air quality screening tool produced by Highways England |
| CIL | Community Infrastructure Levy |
| EU | European Union |
| FDMS | Filter Dynamics Measurement System |
| LAQM | Local Air Quality Management |
| $NO_2$ | Nitrogen Dioxide |
| $NO_x$ | Nitrogen Oxides |
| $PM_{10}$ | Airborne particulate matter with an aerodynamic diameter of 10μm (micrometres or microns) or less |
| $PM_{2.5}$ | Airborne particulate matter with an aerodynamic diameter of 2.5μm or less |
| QA/QC | Quality Assurance and Quality Control |
| $SO_2$ | Sulphur Dioxide |
